

GKB LEAFREDUCER

The Leaf Reducer 150 is a sustainable solution for managing fallen leaves, converting leaf waste into a natural soil improver in a single pass. Instead of collecting and disposing of leaves, the machine pulverises them into a fine mulch and returns valuable nutrients back into the surface, helping improve soil health while reducing maintenance time and costs.

Developed in response to demand from local authorities and turf managers, the Leaf Reducer offers an efficient alternative to blowers, vacuums and transport for leaf collection. It is ideal for use in parks, lawns, gardens and urban green spaces.

The machine works by collecting leaves with flails before a turbine fragments the material and draws it into the unit, where it is milled into a fine mulch. The processed material is then discharged back onto the surface through an adjustable rear ejector.

Key benefits include reduced landfill and disposal costs, improved soil quality, and a more efficient working method with potential CO₂ reduction of up to 65%.
